U.S. DEPARTMENT OF AGRICULTURE - Forest Service

THE ANNUAL FIRE REPORT FOR THE NATIONAL FORESTS IS A COMPILATION OF STATISTICS FOR ALL FOREST FIRES OCCURRING ON NATIONAL FOREST LAND AND OTHER LANDS PROTECTED BY THE FOREST SERVICE.

Table 1. Number of Fires by General Causes

Table 2. Area Burned by General Causes

Table 3. Area Burned and Tangible Damage

Table 4. Tangible Damage by Major Causes

Table 5. Number of Fires by Major Causes and Size Class

The extensive use of highly trained firemen and aircraft to quickly move them has greatly increased the efficiency of the fire control force. Swift attack, with strong reinforcement when needed, means lower resource losses and reduced firefighting costs.

THE 1967 FOREST FIRE REPORT

The Forest Service in 1967 successfully met the greatest challenge it has faced from fire in nearly 60 years. Not since 1910 have comparable critical weather conditions presented so serious a threat to National Forest resources. During that year, some 4.9 million acres were blackened. In contrast, the area burned in 1967 was held to less than five percent of that staggering record loss. The 1967 losses, in fact, were under those sustained in many less severe recent seasons.

Centering in the West, and particularly in the Northwestern States, the fire crisis was swiftly met by the greatest mobilization of manpower and equipment in the history of the Forest Service. Supervisory and technical personnel in record numbers were dispatched to the Northwest from all Forest Service Regions to assist in directing suppression efforts. Modern techniques and equipment were severely tested -- and their effectiveness was clearly demonstrated. Hundreds of aircraft played key roles in the massive effort. Bulldozers, tankers, and other ground equipment also were essential elements of the fire control force. But in the final analysis, the brunt of the suppression task was borne by the thousands of firefighters who battled the flames in close quarters. Most of these men were in trained crews drawn from many Western States. Specialized Forest Service suppression crews were the first

sent to support local forces; they attacked fires in the most difficult situations and performed with untiring diligence. These crews were quickly followed by trained crews of Indians, Spanish-Americans, agricultural workers, and others. In all, some 15,000 men were mobilized during the worst month-long period.

1967 Weather Conditions Severe

A dry winter and spring caused a severe spring fire season in many areas of the South and Southwest. In contrast, over much of the rest of the country conditions were abnormally cool and wet, and fire forces looked forward hopefully to the possibility of a normal fire season after the long, hard fire year of 1966. By June, however, the pattern had begun to change, particularly in the Northwest. There, millions of acres of forest land soon became tinder dry, as high temperatures and below normal precipitation were widespread from June into September. Some localities recorded up to 90 consecutive rainless days. Temperature and precipitation records fell as the area experienced its warmest and driest summer.

In late September general rains finally fell over much of the West, reducing fire dangers. In Southern California, however, dry conditions continued into early November, and hot, arid Santa Ana winds caused major fire problems there during late October.

Fire Occurrence Up

Above normal lightning activity in many Western areas increased lightning fires to the highest number since 1961. This increase more than offset a drop in man-caused fires, and total fire occurrence rose five percent over 1966 and eight percent over the 1962-66 average.

The increase in lightning fires was particularly great in the parched Northwest forests. There, a succession of "dry" storms (accompanied by little if any precipitation) started some 2,000 fires during one 30-day period. This is a greater number of lightning fires than the area had experienced during the entire fire season in many years.

Man-caused fires decreased nearly ten percent since 1966 to a level below the previous 5-year average. This decrease reflects the effectiveness of stepped-up fire prevention programs in the face of severe burning conditions which prevailed in many areas.

Area Burned Well Below Potential

While the area burned in 1967 was 27 percent greater than the average loss during the preceeding 5 years, it is far below that which could have resulted without the aggressive effort. Larger burned acreages have occurred under less severe conditions in four of the last ten years. The dry fuel conditions enabled 93 fires to spread beyond 300 acres in size (compared to a 5-year annual average of 66) despite fast attack by local forces. Most of these fires, however, were stopped at less than 1,000

acres by strong reinforcement action. The two most costly and damaging fires of the year burned onto the Kaniksu National Forest in Norther Idaho from the adjacent protection area. They were the Trapper Peak fire (16,600 acres, 12,700 of which were in National Forest protection) and the Sundance fire (55,910 acres, 40,482 in National Forest protection). The latter burned onto the Forest in an explosive run unequaled in recent times, sweeping along a four-mile front for nearly 20 miles. These two fires accounted for over 25 percent of the total area burned in the National Forests during the year. Both were lightning-caused.

Air Activity Sets New Records

Aircraft use for fire control activities jumped sharply in 1967 to a record 74,598 flight hours. Many types of aircraft were involved. Transport planes, ranging from the venerable DC-3 to modern jets, hauled men and supplies from distant points to the centers of fire activity. Some saw service over the fires themselves as more than 1.7 million pounds of equipment and supplies were air-dropped to crews in remote locations, and smokejumpers were dropped on 1,247 fires. Smaller aircraft flew many hours on countless detection and fire reconnaissance missions during the busy season.

Helicopter use increased significantly, and proved to be an exceptionally valuable part of the modern fire control force. In addition to scouting duties and delivery of men and equipment to the fireline, they are being used more and more to drop retardants. Although they carry smaller loads than fixed-wing air tankers, their ability to drop with pin-point accuracy makes them an excellent strategic tool. In all, helitankers and fixed-wing air tankers delivered a record 7.7 million gallons of retardants to more than 2,000 fires during the year.

Total fires, by major causes, and acres burned for all National Forests and Grasslands.

Calendar Year	Number of Fires			Acres Burned
